Host the Kit on Hostinger

SHARED / UNLIMITED WEB HOSTING — STEP BY STEP

Tech Guardians · Rj Nehra — Master in Cyber Security

Think Like a Hacker — Protect Like a Defender

No VPS needed · Upload: Cyber-Crime-Awareness-WEB-UPLOAD.zip

🔑 **Two passwords you will use**

1. **Directory password** (server-side, you set it in hPanel — strongest lock)
2. **Dashboard passphrase** (the kit's own login): `TechGuardians@1930` — change it (see last page)

Step 1 — Choose your subdomain

Pick e.g. `awareness.yourdomain.com` (replace with your real domain).

Step 2 — Create the subdomain

1. Log in to **hpanel.hostinger.com**.
2. Your website → **Domains → Subdomains**.
3. Type the prefix (`awareness`) → **Create**.
4. Note the document root, usually `public_html/awareness`.

Step 3 — Upload the web zip

1. **Files → File Manager**.
2. Open the subdomain folder (`public_html/awareness`).
3. **Upload (↑)** → `Cyber-Crime-Awareness-WEB-UPLOAD.zip`.

Step 4 — Extract into the subdomain root

1. Right-click the zip → **Extract** → into the current folder.
2. **index.html must be directly in the subdomain root.** If a subfolder was created, open it, select all, and **Move** everything up one level.
3. Delete the zip afterwards.

Step 5 — Turn on HTTPS (free SSL)

1. **Security → SSL** → ensure SSL is **active** (install if offered).
2. The kit's `.htaccess` already forces HTTPS (needed for the login gate).

Step 6 — Password-protect the folder (server-side lock) 🔒

1. **Advanced → Directory Privacy** (a.k.a. "Password Protect Directories").
2. Select the subdomain folder (`awareness`).
3. Set a **username** + **strong password** → **Save**.
4. Now visitors must pass this login **before** they see the kit.

Step 7 — Open and test (live!)

Visit `https://awareness.yourdomain.com` and check in order:

1. **Directory password** prompt → enter it.
2. **Tech Guardians Secure Access** → dashboard passphrase (`TechGuardians@1930`).
3. **Master Dashboard** loads with your logo.
4. **▶ Start Live Walkthrough** → demos present one by one (Next / Previous / Auto-play).
5. **Phishing** card → the live simulation opens and reveals itself.
6. A few demo cards → render as clean pages in the viewer.

If all six work, you are live and ready to show.

The "one-by-one, like a human" experience

- **Live Walkthrough** steps through the whole seminar in order: progress bar, one demo per screen, Auto-play (~9s) or manual Next/Previous, with content revealing section-by-section. Arrow keys work too.
- Every dashboard card opens in the in-browser viewer, so Markdown renders beautifully — no downloads.

Change the dashboard passphrase

On your computer run `ACCESS_CONTROL/set_password.sh` (or `.bat`). It updates `LOGIN.html` , `MASTER_DASHBOARD.html` , `view.html` , `walkthrough.html` . Then re-upload those 4 files (or rebuild & re-upload the zip).

Security notes

- The phishing page is a **safe simulation** (stores/sends nothing), but keep **Directory Privacy ON** and the `robots.txt` (no indexing) so it is not public/indexed.
- The web zip **excludes** the password PDF and all scripts — do not upload them to the server.
- `.htaccess` also denies `.sh/.bat/.command/.zip` and the guide PDF.

Troubleshooting

- **Redirect loop / blank:** ensure index.html is in the subdomain root and SSL is active.
- **Cards show raw text:** use the dashboard cards (they route through view.html); on a server it always renders.
- **500 error:** a module may be missing; rules are wrapped in <IfModule> guards — if needed, temporarily rename .htaccess.
- **Walkthrough empty:** confirm manifest.json is in the root.
